## PH 253 Exam I

## Instructions

I. Solve four of the six problems below. All problems have equal weight.
2. Clearly mark your which problems you have chosen using the tick box.
3. Do your work on separate sheets. Staple them to this exam paper when you are finished.
4. You are allowed I sheet of standard $8.5 \times \mathrm{II}$ in paper and a calculator.

- I. In a test of the relativistic time dilation effect, physicists compared the rates of vibration of nuclei of iron moving at different speeds. One sample of iron nuclei was placed on the rim of a high-speed rotor; another sample of similar nuclei was placed at the center. The radius of the rotor was 0.1 m , and it was rotated at $35000 \mathrm{rev} / \mathrm{min}$. (a) Under these conditions, what was the speed of the rim of the rotor relative to the center? (b) What was the time dilation factor of the sample at the rim compared with the sample at the center? Note the following useful approximations for $v \ll \mathrm{c}$ :

$$
\begin{gather*}
{\left[1-\left(\frac{v}{c}\right)^{2}\right]^{1 / 2} \approx 1-\frac{1}{2}\left(\frac{v}{c}\right)^{2}}  \tag{I}\\
{\left[1-\left(\frac{v}{c}\right)^{2}\right]^{-1 / 2} \approx 1+\frac{1}{2}\left(\frac{v}{c}\right)^{2}} \tag{2}
\end{gather*}
$$

- 2. A $\mathrm{K}^{0}$ particle at rest spontaneously decays into a $\pi^{+}$particle and a $\pi^{-}$particle. What will be the speed of each of the latter? The mass of the $\mathrm{K}^{0}$ is $8.87 \times 10^{-28} \mathrm{~kg}$, and the masses of the $\pi^{+}$and $\pi^{-}$ particles are $2.49 \times 10^{-28} \mathrm{~kg}$ each.
- 3. Show that at long wavelengths, Planck's radiation law (see formula sheet) reduces to the RayleighJeans law,

$$
\begin{equation*}
I(\lambda, T)=\frac{(\text { const }) k_{b} T}{\lambda^{4}} \tag{3}
\end{equation*}
$$

Note the series expansion $e^{x}=\sum x^{n} / n!$.

- 4. A 0.700 MeV photon (Compton) scatters off a free electron such that the scattering angle of the photon is twice the scattering angle of the electron. Determine (a) the scattering angle for the electron and (b) the final speed of the electron.
- 5. X-ray photons of wavelength 0.154 nm are produced by a copper source. Suppose that $1.00 \times 10^{18}$ of these photons are absorbed by the target each second.
(a) What is the total momentum $p$ transferred to the target each second?
(b) What is the total energy E of the photons absorbed by the target each second?
(c) If the beam shines perpendicularly onto a perfectly reflecting surface, what force does it exert on the surface? Recall $\mathrm{F}=\Delta \mathrm{p} / \Delta \mathrm{t}$.
(d) For these values, verify that the force on the target is related to the rate of energy transfer by

$$
\begin{equation*}
\frac{\mathrm{dp}}{\mathrm{dt}}=\frac{1}{\mathrm{c}} \frac{\mathrm{dE}}{\mathrm{dt}} \tag{4}
\end{equation*}
$$

-6. A student studying the photoelectric effect from two different metals records the following information: (i) the stopping potential for photoelectrons released from metal I is 1.48 V larger than that for metal 2, and (ii) the threshold frequency for metal I is $40.0 \%$ smaller than that for metal 2. Determine the work function of each metal.

Constants:

$$
\begin{aligned}
\mathrm{N}_{\mathrm{A}} & =6.022 \times 10^{23} \text { things } / \mathrm{mol} \\
\mathrm{k}_{\mathrm{e}} & \equiv 1 / 4 \pi \epsilon_{\mathrm{o}}=8.98755 \times 10^{9} \mathrm{~N} \cdot \mathrm{~m}^{2} \cdot \mathrm{C}^{-2} \\
\epsilon_{\mathrm{o}} & =8.85 \times 10^{-12} \mathrm{C}^{2} / \mathrm{N} \cdot \mathrm{~m}^{2} \\
\mu_{\mathrm{o}} & \equiv 4 \pi \times 10^{-7} \mathrm{~T} \cdot \mathrm{~m} / \mathrm{A} \\
\mathrm{e} & =1.60218 \times 10^{-19} \mathrm{C} \\
\mathrm{~h} & =6.6261 \times 10^{-34} \mathrm{~J} \cdot \mathrm{~s}=4.1357 \times 10^{-15} \mathrm{eV} \cdot \mathrm{~s} \\
\hbar & =\frac{\mathrm{h}}{2 \pi} \\
\mathrm{k}_{\mathrm{B}} & =1.38065 \times 10^{-23} \mathrm{~J} \cdot \mathrm{~K}^{-1}=8.6173 \times 10^{-5} \mathrm{eV} \cdot \mathrm{~K}^{-1} \\
\mathrm{c} & =\frac{1}{\sqrt{\mu_{0} \epsilon_{0}}}=2.99792 \times 10^{8} \mathrm{~m} / \mathrm{s} \\
\mathrm{hc} & =1240 \mathrm{eV} \cdot \mathrm{~nm} \\
\mathrm{~m}_{\mathrm{e}} & =9.10938 \times 10^{-31} \mathrm{~kg} \quad \mathrm{~m}_{\mathrm{e}} \mathrm{c}^{2}=510.998 \mathrm{keV} \\
\mathrm{~m}_{\mathrm{p}} & =1.67262 \times 10^{-27} \mathrm{~kg} \quad \mathrm{~m}_{\mathrm{p}} \mathrm{c}^{2}=938.272 \mathrm{MeV}
\end{aligned}
$$

## Quadratic formula:

$$
0=a x^{2}+b x^{2}+c \Longrightarrow x=\frac{-b \pm \sqrt{b^{2}-4 a c}}{2 a}
$$

## Basic Equations:

$$
\begin{aligned}
& \overrightarrow{\mathrm{F}}_{\text {net }}=\frac{\mathrm{d} \overrightarrow{\mathrm{p}}}{\mathrm{dt}}=\mathrm{m} \overrightarrow{\mathrm{a}} \quad \text { Newton's Second Law } \\
& \overrightarrow{\mathrm{F}}_{\text {centr }}=-\frac{m v^{2}}{\mathrm{r}} \hat{\mathrm{r}} \quad \text { Centripetal }
\end{aligned}
$$

## E \& M

$$
\begin{aligned}
\overrightarrow{\mathrm{F}}_{12} & =\mathrm{k}_{\mathrm{e}} \frac{\mathrm{q}_{1} \mathrm{q}_{2}}{\mathrm{r}_{12}^{2}} \hat{\mathrm{r}}_{12}=\mathrm{q}_{2} \overrightarrow{\mathrm{E}}_{1} \quad \overrightarrow{\mathrm{r}}_{12}=\overrightarrow{\mathrm{r}}_{1}-\overrightarrow{\mathrm{r}}_{2} \\
\overrightarrow{\mathrm{E}}_{1} & =\overrightarrow{\mathrm{F}}_{12} / \mathrm{q}_{2}=\mathrm{k}_{\mathrm{e}} \frac{\mathrm{q}_{1}}{\mathrm{r}_{12}^{2}} \hat{\mathrm{r}}_{12} \\
\overrightarrow{\mathrm{~F}}_{\mathrm{B}} & =\mathrm{q} \vec{v} \times \overrightarrow{\mathrm{B}}
\end{aligned}
$$

EM Waves:

$$
\begin{aligned}
& c=\lambda f=\frac{|\overrightarrow{\mathrm{E}}|}{|\overrightarrow{\mathrm{B}}|} \\
& \mathrm{I}=\left[\frac{\text { photons }}{\text { time }}\right]\left[\frac{\text { energy }}{\text { photon }}\right]\left[\frac{1}{\text { Area }}\right] \\
& \mathrm{I}=\frac{\text { energy }}{\text { time } \cdot \text { area }}=\frac{\mathrm{E}_{\max } B_{\max }}{2 \mu_{0}}=\frac{\text { power }(\mathscr{P})}{\text { area }}=\frac{\mathrm{E}_{\max }^{2}}{2 \mu_{0} \mathrm{c}}
\end{aligned}
$$

Blackbody

$$
\begin{aligned}
\mathrm{E}_{\text {tot }} & =\sigma \mathrm{T}^{4} \quad \sigma=5.672 \times 10^{-8} \mathrm{~W} \cdot \mathrm{~m}^{-2} \cdot \mathrm{~K}^{-4} \\
\mathrm{~T} \lambda_{\max } & =0.29 \times 10^{-2} \mathrm{~m} \cdot \mathrm{~K} \quad \text { Wien } \\
\mathrm{E}_{\text {quantum }} & =\mathrm{hf} \\
\mathrm{E}_{\text {oscillator }} & =\mathrm{hf} /\left(e^{\left.\mathrm{hf} / \mathrm{k}_{\mathrm{B}} T^{\top}-1\right)}\right. \\
\mathrm{I}(\lambda, \mathrm{~T}) & =\frac{\text { (const) }}{\lambda^{5}}\left[e^{\left.\frac{h c}{\lambda k_{b}}-1\right]^{-1}}\right. \\
\mathrm{I}(\mathrm{f}, \mathrm{t}) & =(\text { const }) \mathrm{f}^{3}\left[e^{\frac{h f}{\mathrm{k}_{\mathrm{b}} \mathrm{~T}}}-1\right]^{-1}
\end{aligned}
$$

Relativity

$$
\begin{aligned}
\gamma & =\frac{1}{\sqrt{1-\frac{v^{2}}{c^{2}}}} \\
\Delta \mathrm{t}_{\text {moving }}^{\prime} & =\gamma \Delta \mathrm{t}_{\text {stationary }}=\gamma \Delta \mathrm{t}_{\mathrm{p}} \\
\mathrm{~L}_{\text {moving }}^{\prime} & =\frac{\mathrm{L}_{\text {stationary }}}{\gamma}=\frac{\mathrm{L}_{\mathrm{p}}}{\gamma} \\
\mathrm{x}^{\prime} & =\gamma(\mathrm{x}-v \mathrm{t}) \\
\mathrm{t}^{\prime} & =\gamma\left(\mathrm{t}-\frac{v x}{\mathrm{c}^{2}}\right) \\
v_{\mathrm{obj}} & =\frac{v+v_{\mathrm{obj}}^{\prime}}{1+\frac{v v_{\mathrm{obj}}^{\prime}}{c^{2}}} \\
\mathrm{KE} & =(\gamma-1) \mathrm{mc}^{2}=\sqrt{\mathrm{m}^{2} \mathrm{c}^{4}+\mathrm{c}^{2} \mathrm{p}^{2}}-\mathrm{mc} \mathrm{c}^{2} \\
\mathrm{E}_{\text {rest }} & =\mathrm{m} \mathrm{c}^{2} \\
\mathrm{p} & =\gamma \mathrm{m} v \\
\mathrm{E}^{2} & =\mathrm{p}^{2} \mathrm{c}^{2}+\mathrm{m}^{2} \mathrm{c}^{4}=\left(\gamma \mathrm{mc}^{2}\right)^{2}
\end{aligned}
$$

## Quantum

$$
\begin{aligned}
\mathrm{E} & =\mathrm{hf} \quad \mathrm{p}=\mathrm{h} / \lambda=\mathrm{E} / \mathrm{c} \quad \lambda f=\mathrm{c} \quad \text { photons } \\
\lambda_{\mathrm{f}}-\lambda_{\mathrm{i}} & =\frac{h}{m_{\mathrm{e}} \mathrm{c}}(1-\cos \theta) \\
\lambda & =\frac{h}{|\vec{p}|}=\frac{h}{\gamma m v} \approx \frac{h}{m v} \\
\Delta x \Delta p & \geqslant \frac{h}{4 \pi} \\
\Delta \mathrm{E} \Delta t & \geqslant \frac{h}{4 \pi} \\
e V_{\text {stopping }} & =K E_{\text {electron }}=h f-\varphi=h f-W
\end{aligned}
$$

## Calculus of possible utility:

$$
\begin{aligned}
\int \frac{1}{x} d x & =\ln x+c \\
\int u d v & =u v-\int v d u \\
\int \sin a x d x & =-\frac{1}{a} \cos a x+C \\
\int \cos a x d x & =\frac{1}{a} \sin a x+C \\
\frac{d}{d x} \tan x & =\sec ^{2} x=\frac{1}{\cos ^{2} x}
\end{aligned}
$$

Vectors:

$$
\begin{aligned}
|\overrightarrow{\mathrm{F}}| & =\sqrt{\mathrm{F}_{x}^{2}+\mathrm{F}_{y}^{2}} \text { magnitude } \theta=\tan ^{-1}\left[\frac{F_{y}}{F_{x}}\right] \text { direction } \\
\hat{\mathbf{r}} & =\overrightarrow{\mathrm{r}} /|\overrightarrow{\mathrm{r}}| \quad \text { construct any unit vector } \\
\text { let } \quad \overrightarrow{\mathrm{a}} & =\mathrm{a}_{x} \hat{\mathbf{x}}+\mathrm{a}_{y} \hat{\mathbf{y}}+\mathrm{a}_{z} \hat{\mathbf{z}} \text { and } \overrightarrow{\mathrm{b}}=\mathrm{b}_{\mathrm{x}} \hat{\boldsymbol{x}}+\mathrm{b}_{\mathrm{y}} \hat{\mathbf{y}}+\mathrm{b}_{z} \hat{\mathbf{z}}
\end{aligned}
$$

$\vec{a} \cdot \vec{b}=a_{x} b_{x}+a_{y} b_{y}+a_{z} b_{z}=\sum_{i=1}^{n} a_{i} b_{i}=|\vec{a}||\vec{b}| \cos \theta$
$|\vec{a} \times \vec{b}|=|\vec{a}||\vec{b}| \sin \theta$
$\vec{a} \times \vec{b}=\left|\begin{array}{ccc}\hat{\boldsymbol{x}} & \hat{\boldsymbol{y}} & \hat{\boldsymbol{z}} \\ a_{x} & a_{y} & a_{z} \\ b_{x} & b_{y} & b_{z}\end{array}\right|=\left(a_{y} b_{z}-a_{z} b_{y}\right) \hat{\boldsymbol{x}}+\left(a_{z} b_{x}-a_{x} b_{z}\right) \hat{\boldsymbol{y}}+\left(a_{x} b_{y}-a_{y} b_{x}\right) \hat{z}$
