

# electrostatics

or, electric forces when nothing is moving.

## Summarizing the properties of charge:

1. Charge is quantized in units of  $|e| = 1.6 \times 10^{-19} \text{ C}$
2. Electrons carry one unit of negative charge,  $-e$
3. Protons carry one unit positive charge,  $+e$
4. Objects become charged by gaining or losing electrons, not protons
5. Electric charge is always conserved

**Table 3.1:** *Properties of electrons, protons, and neutrons*

<b>Particle</b>	<b>Charge [C]</b>	<b>[e]</b>	<b>Mass [kg]</b>
electron ( $e^-$ )	$-1.60 \times 10^{-19}$	-1	$9.11 \times 10^{-31}$
proton ( $p^+$ )	$+1.60 \times 10^{-19}$	+1	$1.67 \times 10^{-27}$
neutron ( $n^0$ )	0	0	$1.67 \times 10^{-27}$

**Table 3.2:** *Approximate electric field values, in [N/C]*

<b>Source</b>	<b><math> \vec{E} </math></b>	<b>Source</b>	<b><math> \vec{E} </math></b>
Fluorescent lighting tube	10	Atmosphere (fair weather)	$10^2$
Balloon rubbed on hair	$10^3$	Atmosphere (under thundercloud)	$10^4$
Photocopier	$10^5$	Spark in air	$10^6$
Across a transistor gate dielectric	$10^9$	Near electron in hydrogen atom	$10^{11}$

2. Three point charges lie along the  $x$  axis, as shown at left. A positive charge  $q_1 = 15 \mu\text{C}$  is at  $x = 2 \text{ m}$ , and a positive charge of  $q_2 = 6 \mu\text{C}$  is at the origin. Where must a *negative* charge  $q_3$  be placed on the  $x$ -axis **between the two positive charges** such that the resulting electric force on it is zero?

2. Three point charges lie along the  $x$  axis, as shown at left. A positive charge  $q_1 = 15 \mu\text{C}$  is at  $x = 2 \text{ m}$ , and a positive charge of  $q_2 = 6 \mu\text{C}$  is at the origin. Where must a *negative* charge  $q_3$  be placed on the  $x$ -axis **between the two positive charges** such that the resulting electric force on it is zero?

$\sim 0.77 \text{ m}$  from  $q_2$

or

$\sim 1.23 \text{ m}$  from  $q_1$
