## PHYSICS 102

DR. LECLAIR

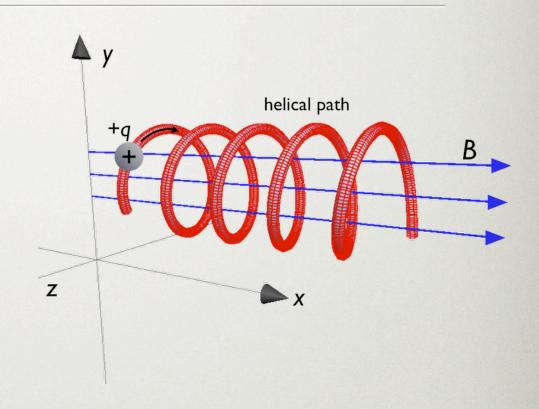

## OFFICIAL THINGS

## Lecture:

- 203 Gallalee
- every day!

## Lab:

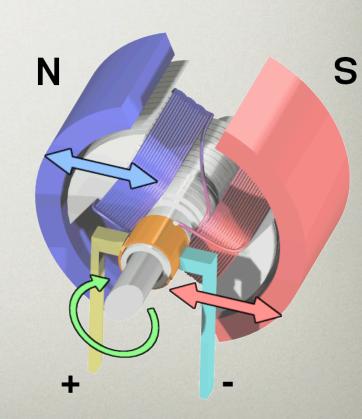

- 329 Gallalee
- M-W-Th ~3 hr block
- will not usually need whole 3 hours

# NO lab today

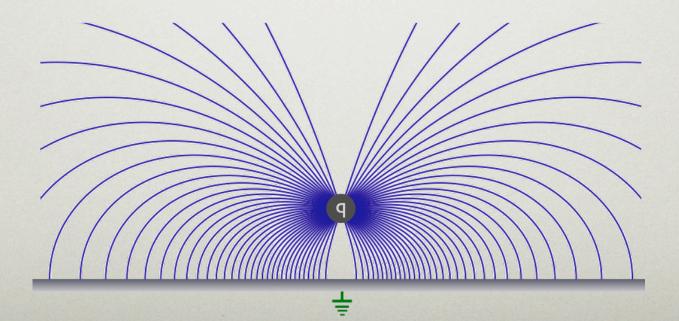

#### OFFICIAL THINGS

- Dr. Patrick LeClair
  - leclair.homework@gmail.com
  - office: 323 Gallalee / 2050 Bevill
  - lab: 1053 Bevill
- Office hours:
  - 1-1:30pm in Gallalee
  - 4:30-5:30pm in Bevill
- other times by appointment

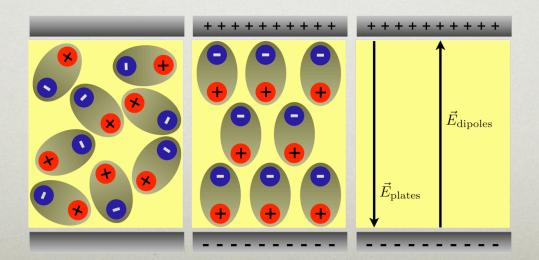

### MISC. FORMAT ISSUES

- we will take a break during lectures ...
- lecture and labs will try to stay linked
- learn a concept, then demonstrate it
- working in groups is encouraged for homework

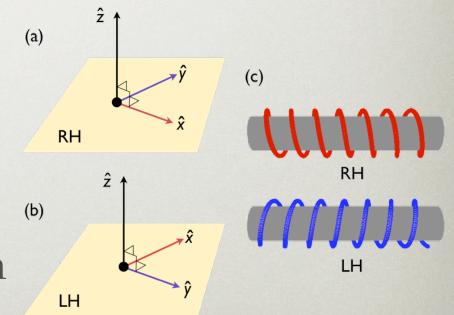

#### SOCIAL INTERACTION

- we need you in groups of 3-4 for labs
- groups are not assigned ...
  - ... so long as they remain functional relationships
  - even distribution of workload

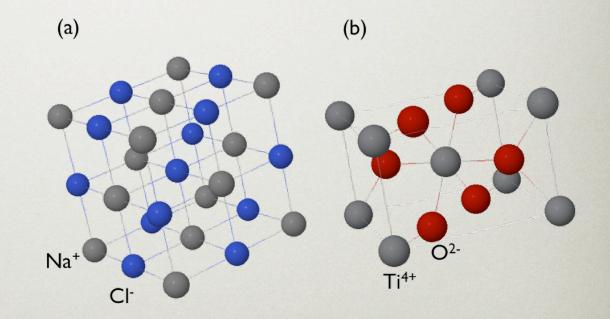

## WHAT WILL WE COVER?

- relativity
- electric forces & fields
- electrical energy & capacitance
- current & resistance
- dc circuits
- magnetism
- electromagnetic induction
- ac circuits & EM waves

#### WHAT WILL WE COVER (CONT.)

- reflection and refraction
- mirrors & lenses
- wave optics
- quantum physics
- atomic physics
- nuclear physics

#### GRADING AND SO FORTH

- labs/exercises 10%
- quizzes 10%

homework 20%

• exams: 3 of them, 20% each

last one during final exam period, not cumulative

### HOMEWORK

 Posted on web page, turn in hard copy or by email

• due date/time is rigid. drop lowest score.

• can collaborate, BUT turn in your own

will go over @ start of lab sessions

#### QUIZZES

- sometimes. during most lab periods.
- only a few questions!
- previous day's work mostly
- 10-15 min anticipated

### LABS / EXERCISES

- try to be on time ...
- something due every day lab is held
- if not a "real" lab:
   in-class exercises or simulations
- drop 1 lab

USUALLY will not take 3 hours

#### STUFF YOU NEED

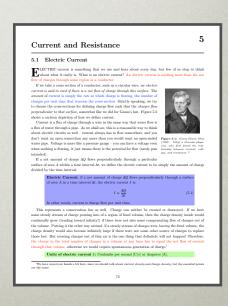

textbook

which one makes little difference

- course notes (optional)
   PDF online (do not print it here)
- calculator

basic with trig/log

notebook

#### SHOWING UP

no make-up of in-class work
 "acceptable" + documented gets you a BYE

missing an exam is seriously bad.
 acceptable reason - makeup or weight final

• lowest lab is dropped. I don't want to know.

#### DISTRACTIONS

- cell phones
  - keep it on a quiet mode.
  - take the call outside if it is urgent

"no food/drink"

at least one break during each lecture

#### **OTHER**

#### Academic misconduct

- do your own work on quizzes & exams
- suspected violations referred to A & S
- teamwork encouraged on labs/homework

## Accessibility/disability accommodations

- for a request 348-4285 Disabilities services
- after initial arrangements, contact me

#### INTERNETS

- we have our own intertubes:
  - http://ph102.blogspot.com
  - updated very frequently. often at odd hours.
  - comments (anonymous even) allowed
  - rss / twitter feeds of posts
- google calendar
- can add RSS feed of blog to facebook
- check blog & calendar before class

## LET'S GET AT IT

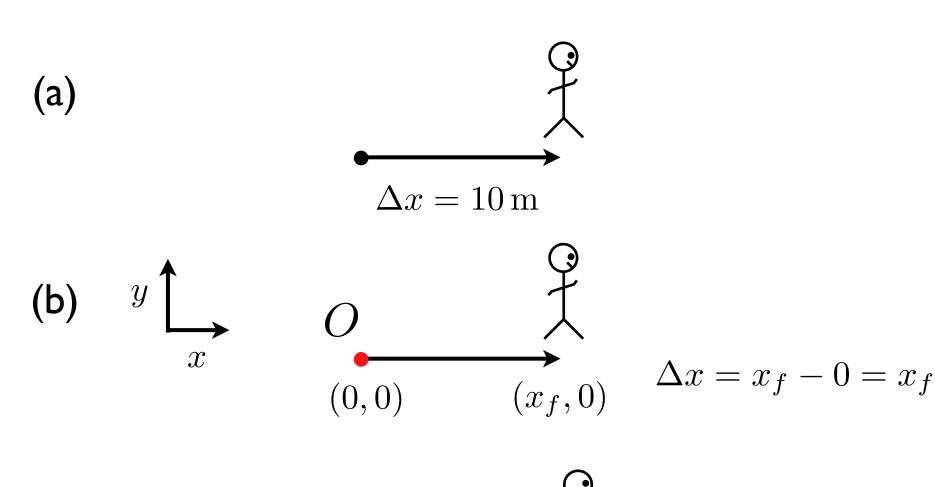

The pace will have to be brutal.

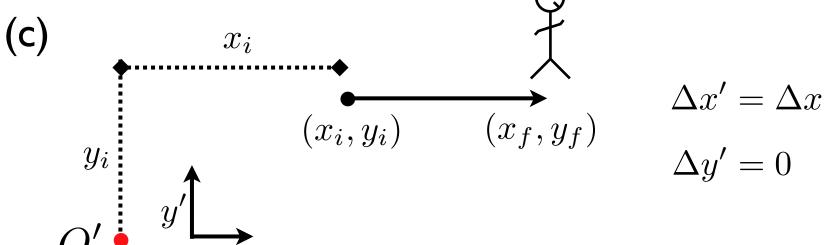

## Today & tomorrow

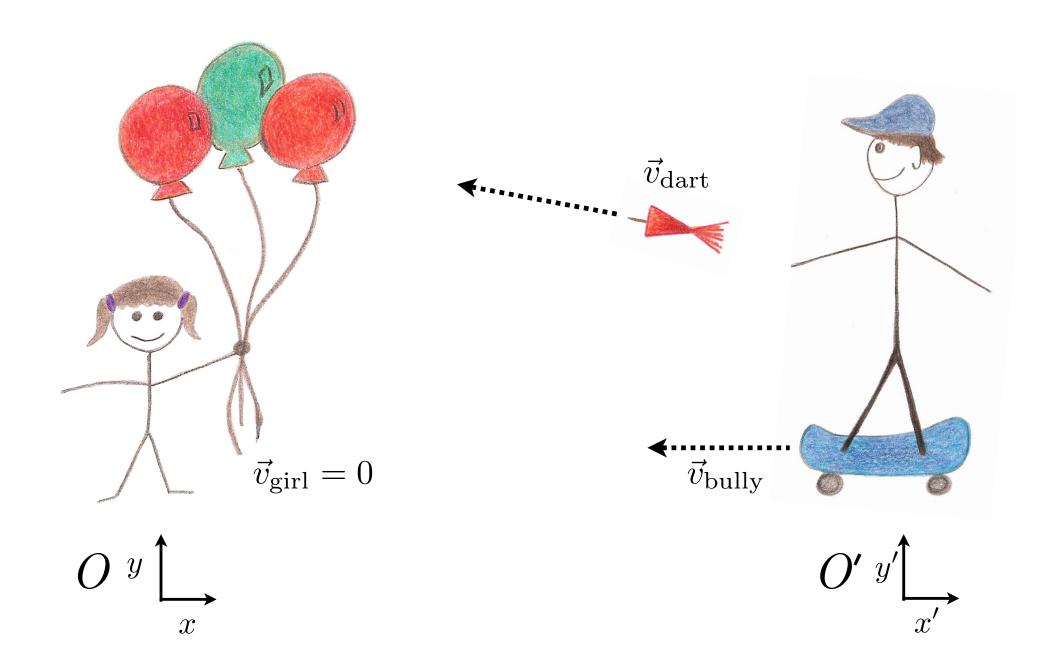

- Relativity (notes Ch. 1)
- no lab today

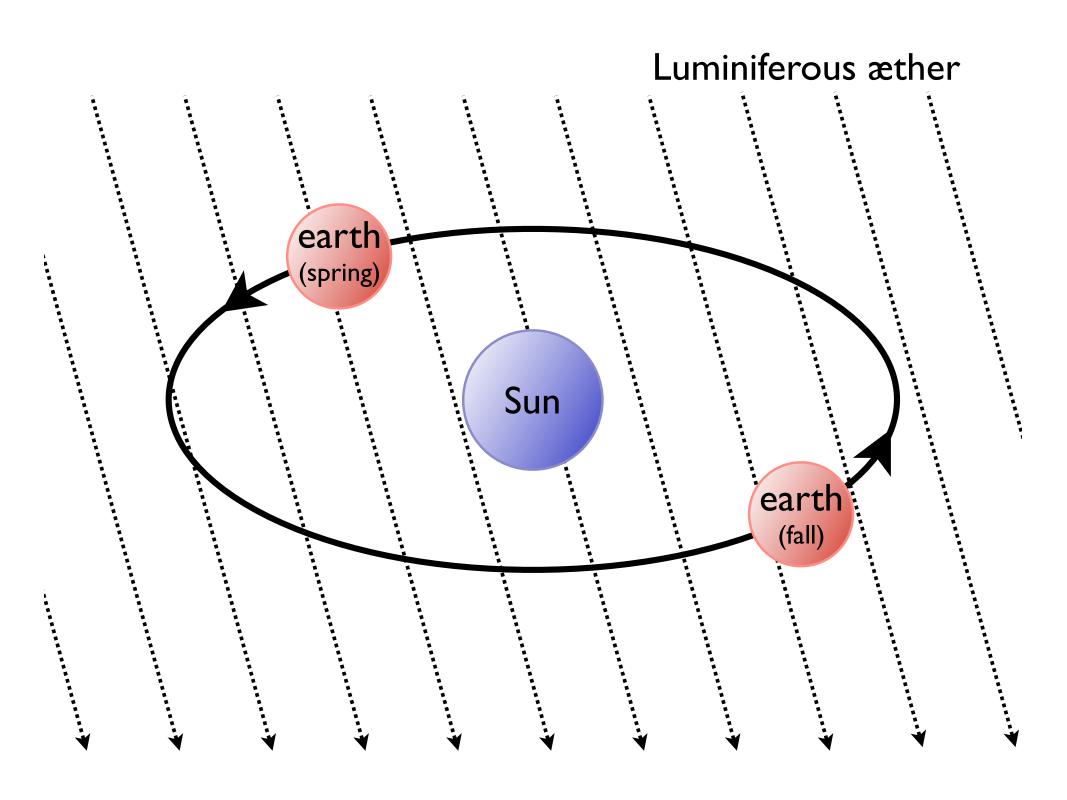

## Monday

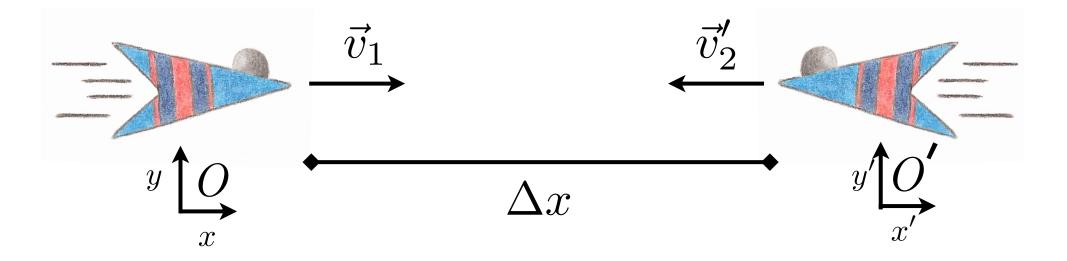

• electric fields & forces

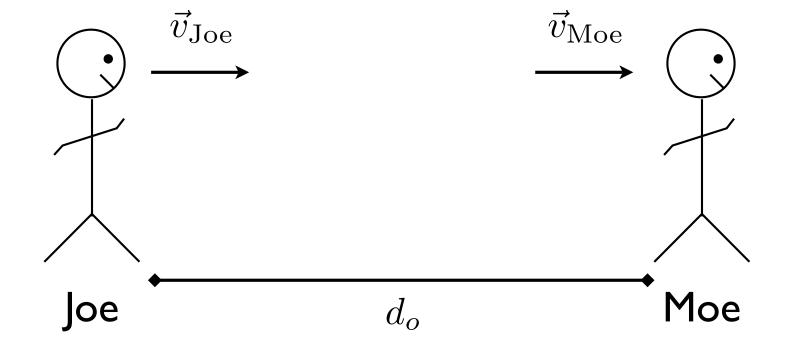

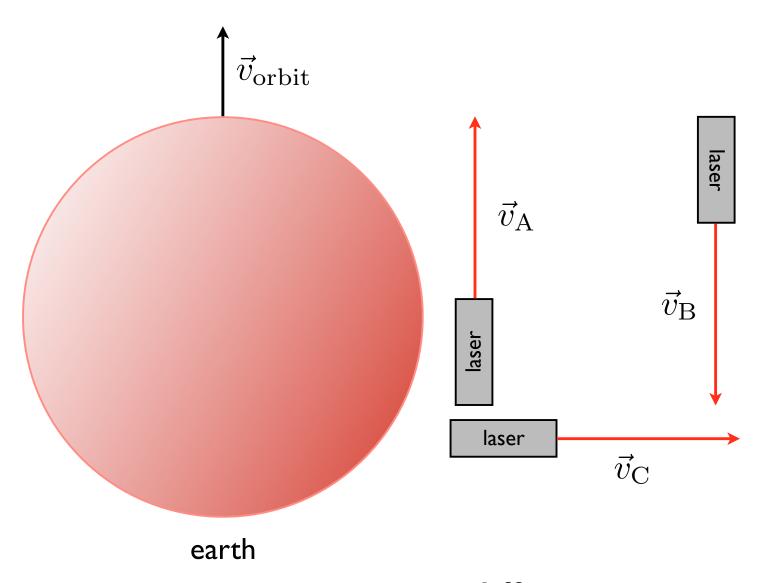

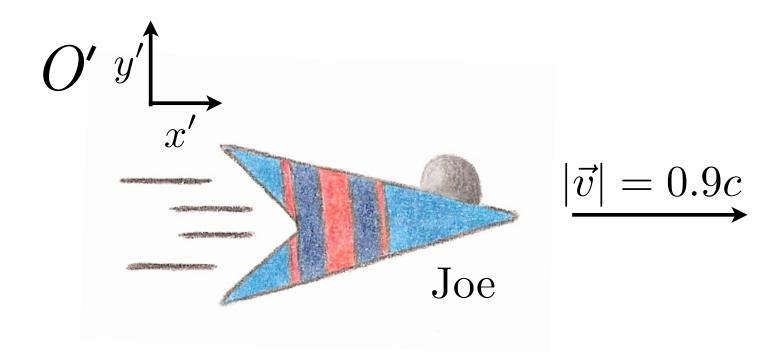

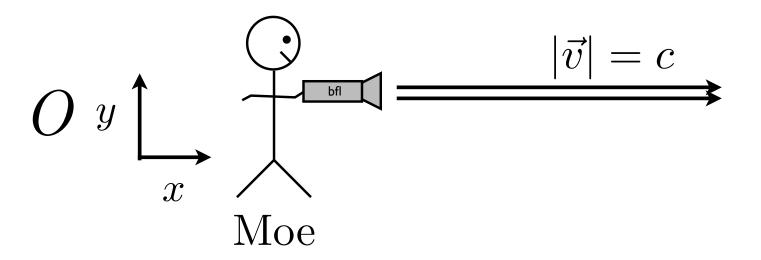

#### **Choosing a coordinate system:**

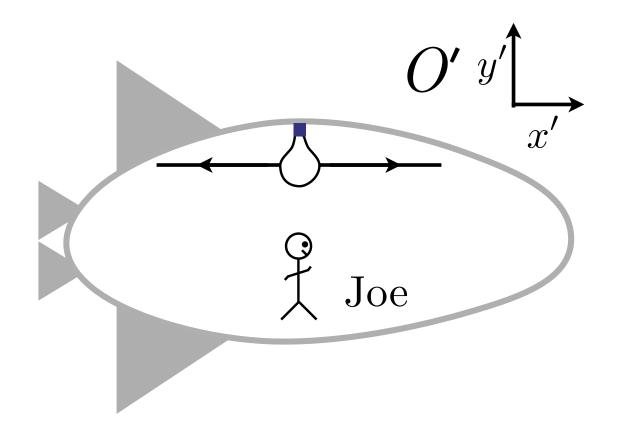

- 1. Choose an origin. This may coincide with a special point or object given in the problem for instance, right at an observer's position, or halfway between two observers. Make it convenient!
- 2. Choose a set of axes, such as rectangular or polar. The simplest are usually rectangular or *Cartesian x-y-z*, though your choice should fit the symmetry of the problem given if your problem has circular symmetry, rectangular coordinates may make life difficult.
- 3. Align the axes. Again, make it convenient for instance, align your *x* axis along a line connecting two special points in the problem. Sometimes a thoughtful but less obvious choice may save you a lot of math!
- 4. Choose which directions are positive and negative. This choice is arbitrary, in the end, so choose the least confusing convention.

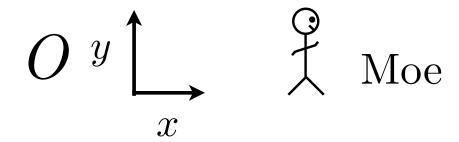

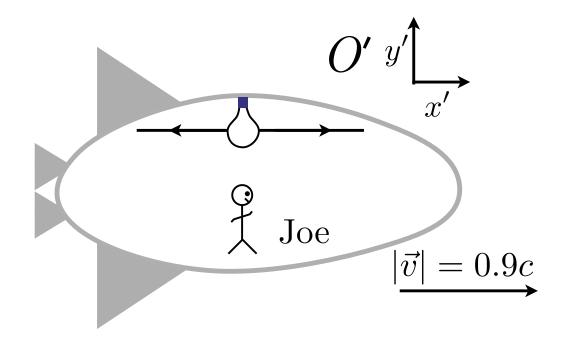

no difference can't measure earth's velocity relative to empty space

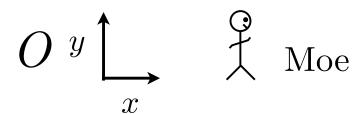

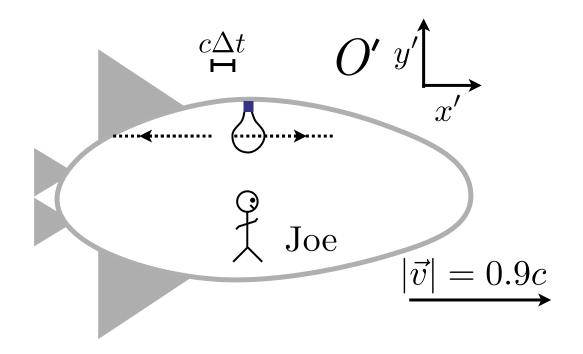

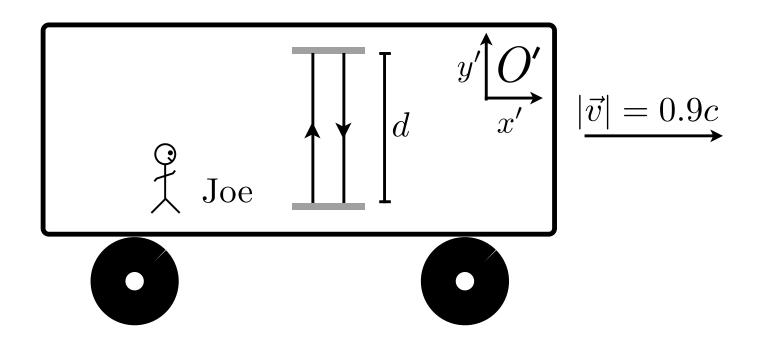

Joe flips on the light he sees the light hit the walls at the same time

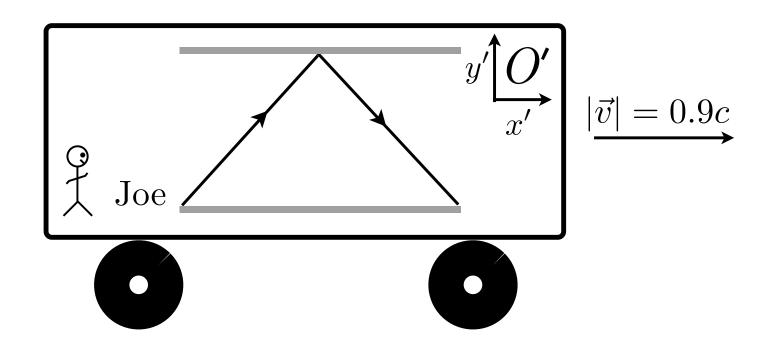

$$O \stackrel{y}{\underset{x}{\bigsqcup}} \stackrel{\bigcirc}{\underset{x}{\bigsqcup}} \operatorname{Moe}$$

What does Moe see?

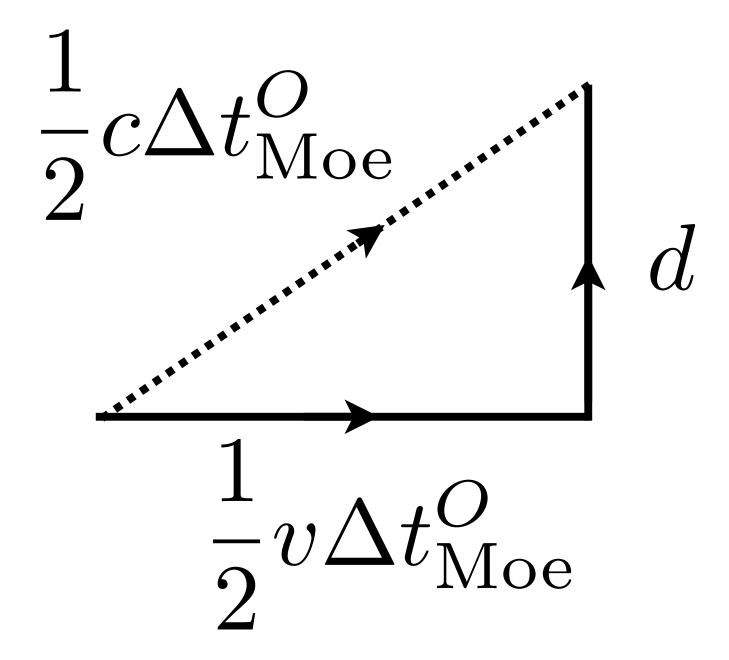

the ship moved;
the origin of the light did not

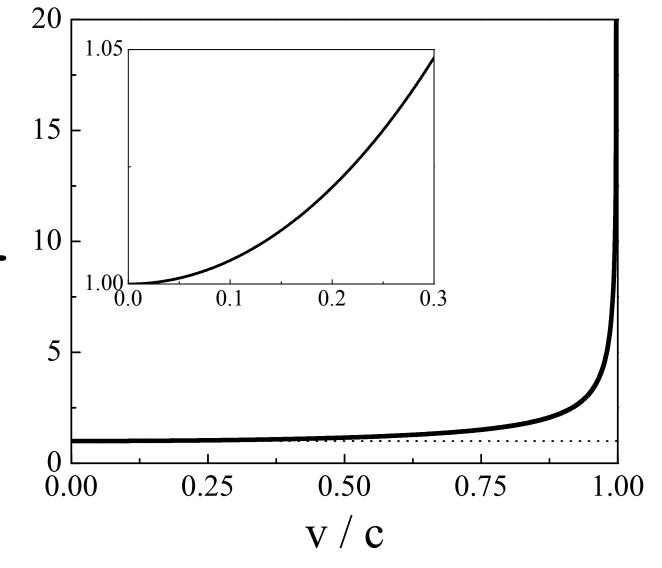

Joe bounces a laser off of some mirrors he counts the round trips this measures distance

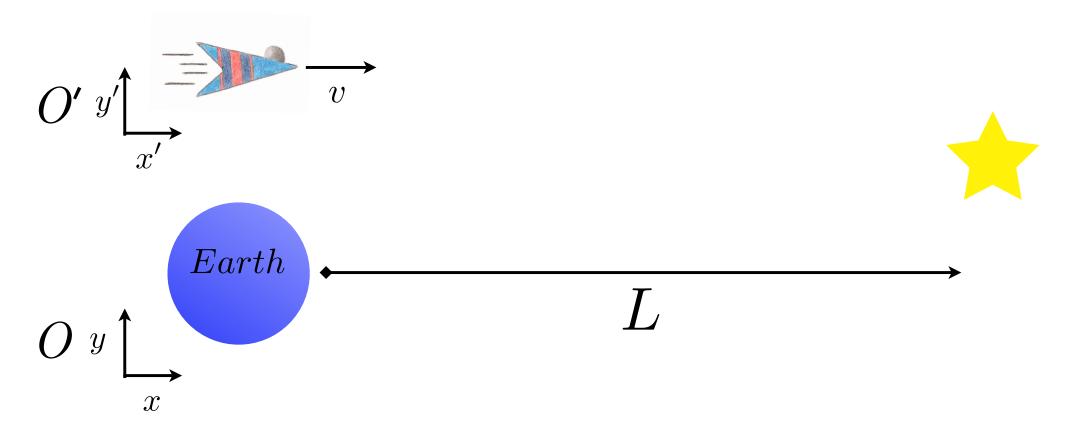

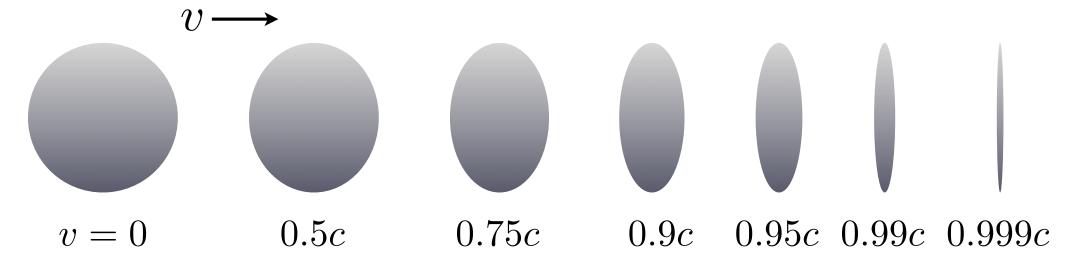

Moe sees the boxcar move; once the light is created, it does not. Moe sees a triangle wave

## **Transformation of distance between reference frames:**

$$x' = \gamma(x - vt) \tag{1.3}$$

$$x = \gamma (x' + vt') \tag{1.3}$$

Here (x,t) is the position and time of an event as measured by an observer in O stationary it. A second observer in O', moving at velocity v, measures the same event to be at position and time (x',t').

## Time measurements in different non-accelerating reference frames:

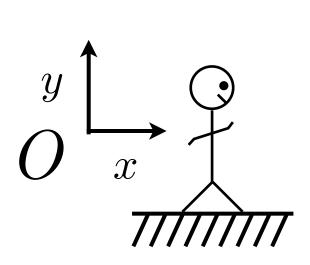

$$t' = \gamma \left( t - \frac{vx}{c^2} \right) \tag{1.46}$$

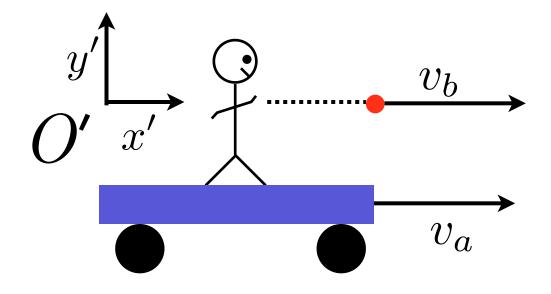

$$t = \gamma \left( t' + \frac{vx'}{c^2} \right) \tag{1.47}$$

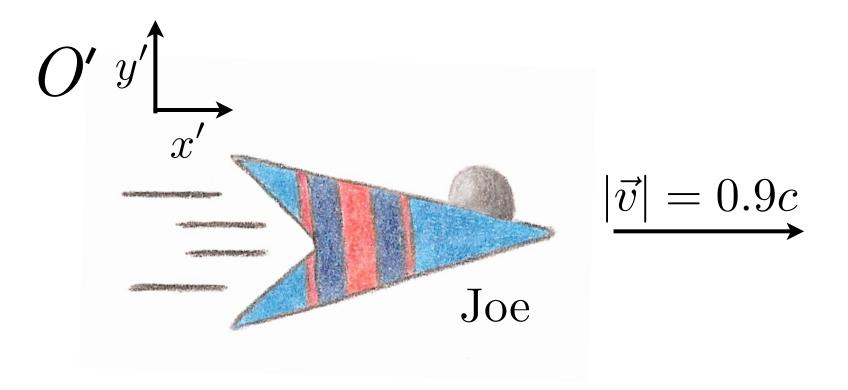

Here (x,t) is the position and time of an event as measured by an observer in O stationary to it. A second observer in O', moving at velocity v, measures the same event to be at position and time (x',t').

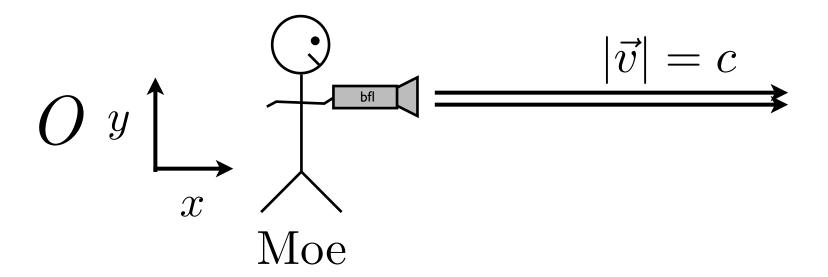

## Elapsed times between events in non-accelerating reference frames:

$$\Delta t' = t_1' - t_2' = \gamma \left( \Delta t - \frac{v \Delta x}{c^2} \right) \tag{1.4}$$

let's work out some problems

	foot 3.0 times per second. What is the frequency Hint: be careful about the difference between time

1.8 taps/sec. The 'proper time' Δt<sub>p</sub> is that measured by the astronaut herself, which is 1/3 of a second between taps (so that there are 3 taps per second). The time interval between taps measured on earth is dilated (longer), so there are less taps per second. For the astronaut:

$$\Delta t_p = rac{1 \, \mathrm{s}}{3 \, \mathrm{taps}}$$

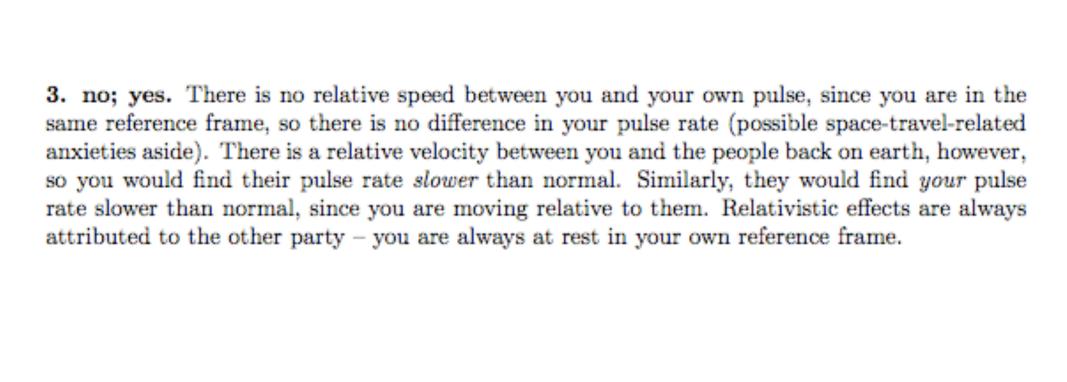

On earth, we measure the dilated time:

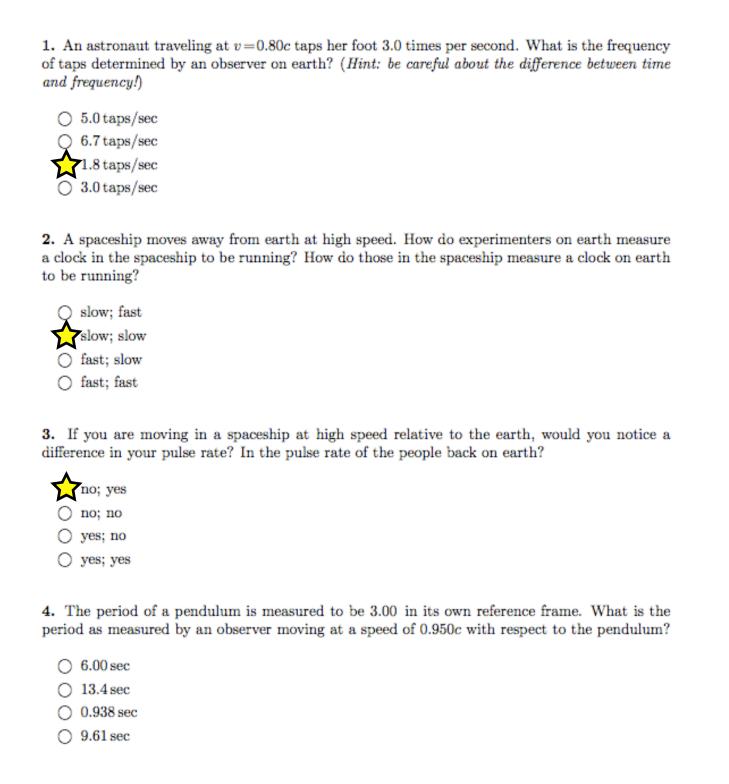

$$\Delta t' = \gamma \Delta t_p = \frac{1}{\sqrt{1 - \frac{0.8^2c^2}{c^2}}} \cdot \left(\frac{1\,\mathrm{s}}{3\,\mathrm{taps}}\right) = \frac{1}{\sqrt{1 - 0.8^2}} \cdot \left(\frac{1\,\mathrm{s}}{3\,\mathrm{taps}}\right) \approx \frac{0.56\,\mathrm{s}}{\mathrm{tap}} = \frac{1\,\mathrm{s}}{1.8\,\mathrm{taps}}$$

<ul> <li>○ no; no</li> <li>○ yes; no</li> <li>○ yes; yes</li> </ul> 4. The period of a pendulum is measured to be 3.00 in its own reference frame. What is the period as measured by an observer moving at a speed of 0.950c with respect to the pendulum? <ul> <li>○ 6.00 sec</li> </ul>

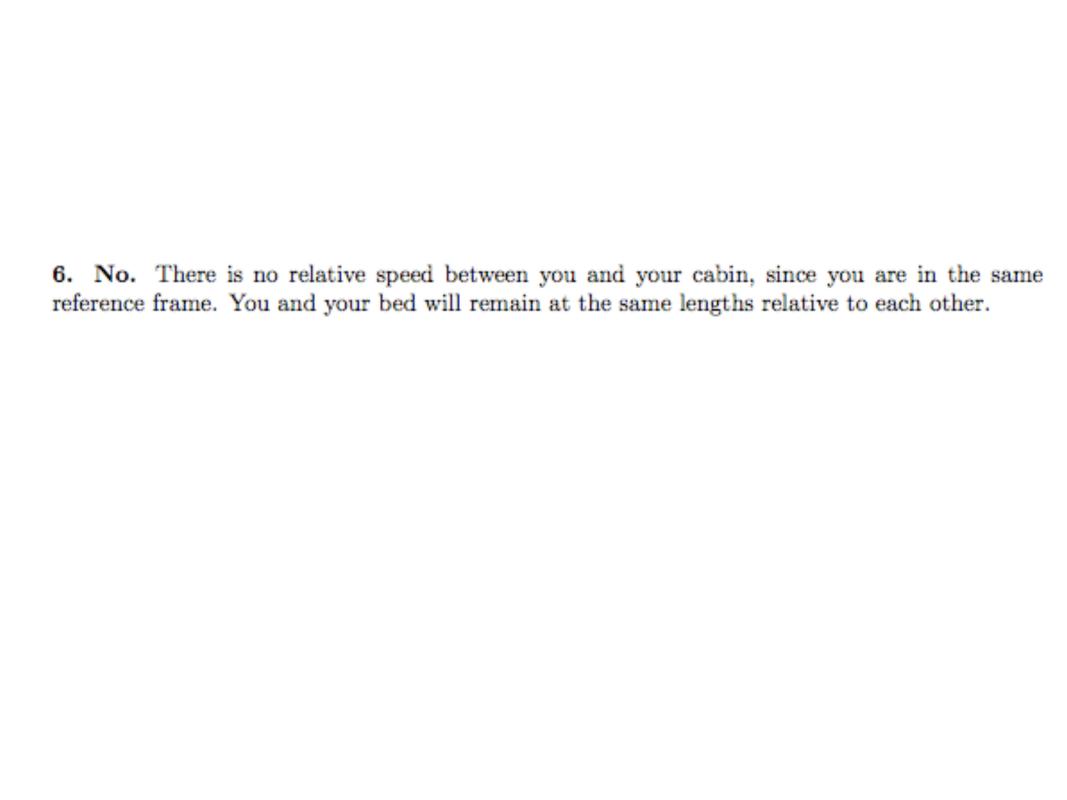

4. 9.61 sec. The proper time is that measured by in the reference frame of the pendulum itself, Δt<sub>p</sub> = 3.00 sec. The moving observer has to observe a longer period for the pendulum, since from the observer's point of view, the pendulum is moving relative to it. Observers always perceive clocks moving relative to them as running slow. The factor between the two times is just γ:

$$\Delta t' = \gamma \Delta t_p = \frac{3.0 \sec}{\sqrt{1 - \frac{0.95^2 c^2}{c^2}}} = \frac{3.0 \sec}{\sqrt{1 - 0.95^2}} \approx 9.61 \sec$$

- 6. You are packing for a trip to another star, and on your journey you will travel at 0.99c. Can you sleep in a smaller cabin than usual, because you will be shorter when you lie down? Explain your answer.
- 7. A deep-space probe moves away from Earth with a speed of 0.88c. An antenna on the probe requires 4.0 s, in probe time, to rotate through 1.0 rev. How much time is required for 1.0 rev according to an observer on Earth?
- 8. A friend in a spaceship travels past you at a high speed. He tells you that his ship is 24 m long and that the identical ship you are sitting in is 18 m long.
- (a) According to your observations, how long is your ship?
- (b) According to your observations, how long is his ship?
- (c) According to your observations, what is the speed of your friend's ship?

- 6. You are packing for a trip to another star, and on your journey you will travel at 0.99c. Can you sleep in a smaller cabin than usual, because you will be shorter when you lie down? Explain your answer.
- 7. A deep-space probe moves away from Earth with a speed of 0.88c. An antenna on the probe requires 4.0 s, in probe time, to rotate through 1.0 rev. How much time is required for 1.0 rev according to an observer on Earth?
- 8. A friend in a spaceship travels past you at a high speed. He tells you that his ship is 24 m long and that the identical ship you are sitting in is 18 m long.
- (a) According to your observations, how long is your ship?
- (b) According to your observations, how long is his ship?
- (c) According to your observations, what is the speed of your friend's ship?

7. 8.42 s. The time interval in the probe's reference frame is the proper one Δt<sub>p</sub> ... which makes sense, since the antenna is part of the probe itself! The probe and antenna are moving relative to the earth, and therefore the earthbound observer measures a longer, dilated time interval Δt':

probe = 
$$\Delta t_p$$
  
earth =  $\Delta t'$   
 $\Delta t'$  =  $\gamma \Delta t_p$ 

As usual, we first need to calculate  $\gamma$ . No problem, given the probe's velocity of 0.88c relative to earth:

$$\gamma = \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}} = \frac{1}{\sqrt{1 - \frac{(0.88c)^2}{c^2}}} = \frac{1}{\sqrt{1 - 0.88^2}} = 2.11$$

The proper time interval for one revolution  $\Delta t_p$  in the probe's reference frame is 4.0 s, so we can readily calculate the time interval observed by the earthbound observer:

$$\Delta t' = \gamma \Delta t_p = 2.11 \cdot (4.0 \, s) = 8.42 \, s$$

- 6. You are packing for a trip to another star, and on your journey you will travel at 0.99c. Can you sleep in a smaller cabin than usual, because you will be shorter when you lie down? Explain your answer.
- 7. A deep-space probe moves away from Earth with a speed of 0.88c. An antenna on the probe requires 4.0 s, in probe time, to rotate through 1.0 rev. How much time is required for 1.0 rev according to an observer on Earth?
- 8. A friend in a spaceship travels past you at a high speed. He tells you that his ship is 24 m long and that the identical ship you are sitting in is 18 m long.
- (a) According to your observations, how long is your ship?
- (b) According to your observations, how long is his ship?
- (c) According to your observations, what is the speed of your friend's ship?

8. 24 m; 18 m; 0.661c. Once again: if you are observing something in your own reference frame, there is no length contraction or time dilation. You always observe your own ship to be the same length. If your friend's ship is 24 m long, and yours is identical, you will measure it to be 24 m.

On the other hand, you are moving relative to his ship, so you would observe his ship to be length contracted, and measure a shorter length. Your friend, on the other hand, will observe exactly the same thing - he will see your ship contracted, by precisely the same amount. Your observation of his ship has to be the same as his observation of his ship - since you are only the two observers, and you both have the same relative velocity, you must observe the same length contraction. If he sees your ship as 18 m long, then you would also see his (identical) ship as 18 m long.

Given the relationship between the contracted and proper length, we can find the relative velocity easily. Your measurement of your own ship is the proper length  $L_p$ , while your measurement of your friend's ship is the contracted length L':

$$\begin{array}{rcl} L_p & = & \gamma L' \\ \Longrightarrow \gamma & = & \frac{L_p}{L'} = \frac{24}{18} = \frac{4}{3} \\ \\ \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}} & = & \frac{4}{3} \\ \\ 1 - \frac{v^2}{c^2} & = & \frac{3^2}{4^2} = \frac{9}{16} \\ \\ \frac{v^2}{c^2} & = & 1 - \frac{9}{16} = \frac{7}{16} \\ \\ v & = & \sqrt{\frac{7}{16}}c = \frac{\sqrt{7}}{4}c \approx 0.661c \end{array}$$
