

## PH 253 Exam 2

## Instructions

1. Solve four of the six problems below. All problems have equal weight.
2. Do your work on separate sheets.
3. Bring your exam paper with you when you leave - you need it for the next homework.
4. You are allowed 1 sheet of standard 8.5x11 in paper and a calculator.

1. Given the wave function

LeClair  
F10

$$\psi(x) = \begin{cases} Ne^{\kappa x} & x < 0 \\ Ne^{-\kappa x} & x > 0 \end{cases} \quad (1)$$

- (a) Find  $N$  needed to normalize  $\psi$ .  
 (b) Find  $\langle x \rangle$ ,  $\langle x^2 \rangle$ , and  $\Delta x$ .

2. An electron in a hydrogen atom is in a state described by the wave function

$$\psi = \frac{1}{\sqrt{3}} \frac{1}{(2a_0)^{3/2}} \frac{r}{a_0} e^{-r/2a_0} \quad (2)$$

where  $a_0$  is the Bohr radius.

- (a) What is the *most probable* value of  $r$ ?  
 (b) What is  $\langle r \rangle$ ?

3. *Quantum harmonic oscillator.* The harmonic oscillator potential is  $V(x) = \frac{1}{2} m \omega_0^2 x^2$ ; a particle of mass  $m$  in this potential oscillates with frequency  $\omega_0$ . The ground state wave function for a particle in the harmonic oscillator potential has the form

$$\psi(x) = A e^{-\alpha x^2} \quad (3)$$

- (a) By substituting  $V(x)$  and  $\psi(x)$  into the one-dimensional time-independent Schrödinger equation, find expressions for the ground-state energy  $E$  and the constant  $\alpha$  in terms of  $m$ ,  $\hbar$ , and  $\omega_0$ .  
 (b) Apply the normalization condition to determine the constant  $A$  in terms of  $m$ ,  $\hbar$ , and  $\omega_0$ .
4. By considering the visible spectrum of hydrogen and  $\text{He}^+$ , show how you could determine spectroscopically if a sample of hydrogen was contaminated with helium. (Hint: look for differences in the visible emission lines,  $\lambda \approx 390 \sim 750$  nm. A difference of 10 nm is easily measured.)

5. Find  $\langle x \rangle$ ,  $\langle x^2 \rangle$ , and  $\Delta x = \sqrt{\langle x^2 \rangle - \langle x \rangle^2}$  (in terms of  $a$ ) for a particle in the ground state of the one-dimensional simple harmonic oscillator, where:

$$\psi_0 = \sqrt{\frac{1}{a\sqrt{\pi}}} e^{-x^2/2a^2} \quad (4)$$

The following integrals may be useful:

$$\int_0^{\infty} x^2 e^{-ax^2} dx = \frac{1}{4} \sqrt{\frac{\pi}{a^3}} \quad \int_{-\infty}^{\infty} x^3 e^{-ax^2} dx = \int_{-\infty}^{\infty} x e^{-ax^2} dx = 0 \quad \int_0^{\infty} x^4 e^{-ax^2} dx = \frac{3}{8} \sqrt{\frac{\pi}{a^5}} \quad (5)$$

6. A particle bound in a certain one-dimensional potential has a wave function described by the following equations:

$$\psi(x) = \begin{cases} 0 & x < -L \\ Ae^{-ikx} \cos \frac{\pi x}{L} & -L \leq x \leq L \\ 0 & x > L \end{cases} \quad (6)$$

- (a) Find the value of the normalization constant  $A$  by enforcing the condition  $\int_{\text{all } x} |\psi(x)|^2 dx = 1$ .  
(b) What is the probability that the particle will be found between  $x=0$  and  $x=L/4$ ?
